

Using Hotspots

Scene links, info points and customizing hotspot style.

Version: September 2026 · app.tourision.com

Hotspots are clickable points that let visitors move through the tour and access information. Tourision has two main hotspot types.

- Scene Link (Go to Scene) — moves the visitor to another scene; used for doors, corridors and room transitions.
- Info Popup (info point) — shows a photo, video and description when clicked; ideal for product details, room features or prices.

Adding a hotspot

1

Choose the mode

In the editor select the hotspot type you want (Go to Scene or Info Popup).

2

Click on the scene

Click the point where the hotspot should appear (tap on mobile).

3

Add the content

For a scene link choose the target scene; for an info point add a title, description, photo or video.

4

Save

Keep your changes with "Save" and try it with "Preview".

Customizing the look

- Size, 7 shapes, border/fill/accent color and animation options.
- Apply the selected hotspot style to every hotspot in the tour with one click.
- Custom icon image and click sound per hotspot (Professional and above).
- Angle lock: save a horizontal rotation limit.

Tip: On the Enterprise plan, AI scene analysis detects doors and corridors and suggests scene links automatically, a big time saver on large tours.

Good practice

- Place transition hotspots in the middle of doors and corridors, slightly below eye level.
- Keep info-point text short and scannable; one topic per hotspot.
- Consistent colors and shapes across a tour help visitors find their way.
